

TRUTH JUSTICE ALGOS

Social Choice III: Strategic Manipulation

Teachers: Ariel Procaccia (this time) and Alex Psomas

REMINDER: THE VOTING MODEL

- Set of **voters** $N = \{1, \dots, n\}$
- Set of alternatives A ; denote $|A| = m$
- Each voter has a **ranking** $\sigma_i \in \mathcal{L}$ over the alternatives; $x \succ_i y$ means that voter i prefers x to y
- A **preference profile** $\sigma \in \mathcal{L}^n$ is a collection of all voters' rankings
- A **voting rule** is a function $f: \mathcal{L}^n \rightarrow A$

MANIPULATION

So far the voters were honest!

MANIPULATION

- Using Borda count
- Top profile: b wins
- Bottom profile: a wins
- By changing his vote, voter 3 achieves a better outcome!

1	2	3
b	b	a
a	a	b
c	c	c
d	d	d

1	2	3
b	b	a
a	a	c
c	c	d
d	d	b

STRATEGYPROOFNESS

- Denote $\sigma_{-i} = (\sigma_1, \dots, \sigma_{i-1}, \sigma_{i+1}, \dots, \sigma_n)$
- A voting rule is **strategyproof (SP)** if a voter can never benefit from lying about his preferences:
$$\forall \sigma \in \mathcal{L}^n, \forall i \in N, \forall \sigma'_i \in \mathcal{L}, f(\sigma) \succsim_i f(\sigma'_i, \sigma_{-i})$$

Question

Max m for which plurality is SP?

- $m = 2$
- $m = 3$
- $m = 4$
- $m = \infty$

STRATEGYPROOFNESS

- A voting rule is **dictatorial** if there is a voter who always gets his most preferred alternative
- A voting rule is **constant** if the same alternative is always chosen
- Constant functions and dictatorships are SP

Dictatorship

Constant function

GIBBARD-SATTERTHWAITE

- A voting rule is **onto** if any alternative can win
- **Theorem (Gibbard-Satterthwaite):** If $m \geq 3$ then any voting rule that is SP and onto is dictatorial
- In other words, any voting rule that is onto and nondictatorial is manipulable

Gibbard

Satterthwaite

PROOF SKETCH OF G-S

- Lemmas (prove in HW1):
 - **Strong monotonicity:** f is SP rule, σ profile, $f(\sigma) = a$. Then $f(\sigma') = a$ for all profiles σ' s.t. $\forall x \in A, i \in N: [a \succ_i x \Rightarrow a \succ'_i x]$
 - **Pareto optimality:** f is SP+onto rule, σ profile. If $a \succ_i b$ for all $i \in N$ then $f(\sigma) \neq b$
- Let us assume that $m \geq n$, and **neutrality:**
 $f(\pi(\sigma)) = \pi(f(\sigma))$ for all $\pi: A \rightarrow A$

PROOF SKETCH OF G-S

- Say $n = 4$ and $A = \{a, b, c, d, e\}$
- Consider the following profile

$\sigma =$

	1	2	3	4
a	a	b	c	d
b	b	c	d	a
c	c	d	a	b
d	d	a	b	c
e	e	e	e	e

- Pareto optimality $\Rightarrow e$ is not the winner
- Suppose $f(\sigma) = a$

PROOF SKETCH OF G-S

1	2	3	4
<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>
<i>b</i>	<i>c</i>	<i>d</i>	<i>a</i>
<i>c</i>	<i>d</i>	<i>a</i>	<i>b</i>
<i>d</i>	<i>a</i>	<i>b</i>	<i>c</i>
<i>e</i>	<i>e</i>	<i>e</i>	<i>e</i>

σ

1	2	3	4
<i>a</i>	<i>d</i>	<i>d</i>	<i>d</i>
<i>d</i>	<i>a</i>	<i>a</i>	<i>a</i>
<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>
<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>
<i>e</i>	<i>e</i>	<i>e</i>	<i>e</i>

σ^1

- Strong monotonicity $\Rightarrow f(\sigma^1) = a$

PROOF SKETCH OF G-S

1	2	3	4
<i>a</i>	<i>d</i>	<i>d</i>	<i>d</i>
<i>d</i>	<i>a</i>	<i>a</i>	<i>a</i>
<i>b</i>	<i>b</i>	<i>b</i>	<i>b</i>
<i>c</i>	<i>c</i>	<i>c</i>	<i>c</i>
<i>e</i>	<i>e</i>	<i>e</i>	<i>e</i>

σ^1

1	2	3	4
<i>a</i>	<i>d</i>	<i>d</i>	<i>d</i>
<i>d</i>	<i>b</i>	<i>a</i>	<i>a</i>
<i>b</i>	<i>c</i>	<i>b</i>	<i>b</i>
<i>c</i>	<i>e</i>	<i>c</i>	<i>c</i>
<i>e</i>	<i>a</i>	<i>e</i>	<i>e</i>

σ^2

Poll 1

How many options are there for $f(\sigma^2)$?

- 1 option
- 2 options
- 3 options
- 4 options

PROOF SKETCH OF G-S

1	2	3	4	1	2	3	4	1	2	3	4
<i>a</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>a</i>	<i>d</i>	<i>d</i>	<i>d</i>	<i>a</i>	<i>d</i>	<i>d</i>	<i>d</i>
<i>d</i>	<i>b</i>	<i>a</i>	<i>a</i>	<i>d</i>	<i>b</i>	<i>b</i>	<i>a</i>	<i>d</i>	<i>b</i>	<i>b</i>	<i>b</i>
<i>b</i>	<i>c</i>	<i>b</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>b</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>c</i>
<i>c</i>	<i>e</i>	<i>c</i>	<i>c</i>	<i>c</i>	<i>e</i>	<i>e</i>	<i>c</i>	<i>c</i>	<i>e</i>	<i>e</i>	<i>e</i>
<i>e</i>	<i>a</i>	<i>e</i>	<i>e</i>	<i>e</i>	<i>a</i>	<i>a</i>	<i>e</i>	<i>e</i>	<i>a</i>	<i>a</i>	<i>a</i>
σ^2				σ^3				σ^4			

- Pareto optimality $\Rightarrow f(\sigma^j) \notin \{b, c, e\}$
- [SP $\Rightarrow f(\sigma^j) \neq d$] $\Rightarrow f(\sigma^j) = a$
- Strong monotonicity $\Rightarrow f(\sigma) = a$ for every σ where 1 ranks *a* first
- Neutrality \Rightarrow 1 is a dictator ■

CIRCUMVENTING G-S

- Restricted preferences (next lecture)
- Money \Rightarrow mechanism design (done)
- Computational complexity (this lecture)

COMPLEXITY OF MANIPULATION

- Manipulation is always possible in theory
- But can we design voting rules where it is difficult in practice?
- Are there “reasonable” voting rules where manipulation is a hard computational problem? [Bartholdi et al. 1989]

THE COMPUTATIONAL PROBLEM

- f -MANIPULATION problem:
 - Given votes of nonmanipulators and a preferred alternative p
 - Can manipulator cast vote that makes p **uniquely** win under f ?
- Example: Borda, $p = a$

1	2	3
b	b	
a	a	
c	c	
d	d	

1	2	3
b	b	a
a	a	c
c	c	d
d	d	b

A GREEDY ALGORITHM

- Rank p in first place
- While there are unranked alternatives:
 - If there is an alternative that can be placed in next spot without preventing p from winning, place this alternative
 - Otherwise return false

EXAMPLE: BORDA

1	2	3	1	2	3	1	2	3
<i>b</i>	<i>b</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>a</i>
<i>a</i>	<i>a</i>		<i>a</i>	<i>a</i>	<i>b</i>	<i>a</i>	<i>a</i>	<i>c</i>
<i>c</i>	<i>c</i>		<i>c</i>	<i>c</i>		<i>c</i>	<i>c</i>	
<i>d</i>	<i>d</i>		<i>d</i>	<i>d</i>		<i>d</i>	<i>d</i>	

1	2	3	1	2	3	1	2	3
<i>b</i>	<i>b</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>a</i>	<i>b</i>	<i>b</i>	<i>a</i>
<i>a</i>	<i>a</i>	<i>c</i>	<i>a</i>	<i>a</i>	<i>c</i>	<i>a</i>	<i>a</i>	<i>c</i>
<i>c</i>	<i>c</i>	<i>b</i>	<i>c</i>	<i>c</i>	<i>d</i>	<i>c</i>	<i>c</i>	<i>d</i>
<i>d</i>	<i>d</i>		<i>d</i>	<i>d</i>		<i>d</i>	<i>d</i>	<i>b</i>

EXAMPLE: COPELAND

1	2	3	4	5
<i>a</i>	<i>b</i>	<i>e</i>	<i>e</i>	<i>a</i>
<i>b</i>	<i>a</i>	<i>c</i>	<i>c</i>	
<i>c</i>	<i>d</i>	<i>b</i>	<i>b</i>	
<i>d</i>	<i>e</i>	<i>a</i>	<i>a</i>	
<i>e</i>	<i>c</i>	<i>d</i>	<i>d</i>	

Preference profile

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
<i>a</i>	-	2	3	5	3
<i>b</i>	3	-	2	4	2
<i>c</i>	2	2	-	3	1
<i>d</i>	0	0	1	-	2
<i>e</i>	2	2	3	2	-

Pairwise elections

EXAMPLE: COPELAND

1	2	3	4	5
<i>a</i>	<i>b</i>	<i>e</i>	<i>e</i>	<i>a</i>
<i>b</i>	<i>a</i>	<i>c</i>	<i>c</i>	<i>c</i>
<i>c</i>	<i>d</i>	<i>b</i>	<i>b</i>	
<i>d</i>	<i>e</i>	<i>a</i>	<i>a</i>	
<i>e</i>	<i>c</i>	<i>d</i>	<i>d</i>	

Preference profile

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
<i>a</i>	-	2	3	5	3
<i>b</i>	3	-	2	4	2
<i>c</i>	2	3	-	4	2
<i>d</i>	0	0	1	-	2
<i>e</i>	2	2	3	2	-

Pairwise elections

EXAMPLE: COPELAND

1	2	3	4	5
<i>a</i>	<i>b</i>	<i>e</i>	<i>e</i>	<i>a</i>
<i>b</i>	<i>a</i>	<i>c</i>	<i>c</i>	<i>c</i>
<i>c</i>	<i>d</i>	<i>b</i>	<i>b</i>	<i>d</i>
<i>d</i>	<i>e</i>	<i>a</i>	<i>a</i>	
<i>e</i>	<i>c</i>	<i>d</i>	<i>d</i>	

Preference profile

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
<i>a</i>	-	2	3	5	3
<i>b</i>	3	-	2	4	2
<i>c</i>	2	3	-	4	2
<i>d</i>	0	1	1	-	3
<i>e</i>	2	2	3	2	-

Pairwise elections

EXAMPLE: COPELAND

1	2	3	4	5
<i>a</i>	<i>b</i>	<i>e</i>	<i>e</i>	<i>a</i>
<i>b</i>	<i>a</i>	<i>c</i>	<i>c</i>	<i>c</i>
<i>c</i>	<i>d</i>	<i>b</i>	<i>b</i>	<i>d</i>
<i>d</i>	<i>e</i>	<i>a</i>	<i>a</i>	<i>e</i>
<i>e</i>	<i>c</i>	<i>d</i>	<i>d</i>	

Preference profile

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
<i>a</i>	-	2	3	5	3
<i>b</i>	3	-	2	4	2
<i>c</i>	2	3	-	4	2
<i>d</i>	0	1	1	-	3
<i>e</i>	2	3	3	2	-

Pairwise elections

EXAMPLE: COPELAND

1	2	3	4	5
<i>a</i>	<i>b</i>	<i>e</i>	<i>e</i>	<i>a</i>
<i>b</i>	<i>a</i>	<i>c</i>	<i>c</i>	<i>c</i>
<i>c</i>	<i>d</i>	<i>b</i>	<i>b</i>	<i>d</i>
<i>d</i>	<i>e</i>	<i>a</i>	<i>a</i>	<i>e</i>
<i>e</i>	<i>c</i>	<i>d</i>	<i>d</i>	<i>b</i>

Preference profile

	<i>a</i>	<i>b</i>	<i>c</i>	<i>d</i>	<i>e</i>
<i>a</i>	-	2	3	5	3
<i>b</i>	3	-	2	4	2
<i>c</i>	2	3	-	4	2
<i>d</i>	0	1	1	-	3
<i>e</i>	2	3	3	2	-

Pairwise elections

WHEN DOES THE ALG WORK?

- **Theorem [Bartholdi et al., SCW 89]:**

Fix $i \in N$ and the votes of other voters. Let f be a rule s.t. \exists function $s(\sigma_i, x)$ such that:

1. For every σ_i , f chooses a alternative that **uniquely** maximizes $s(\sigma_i, x)$
2. $\{y: y <_i x\} \subseteq \{y: y <'_i x\} \Rightarrow s(\sigma_i, x) \leq s(\sigma'_i, x)$

Then the algorithm always decides f -
MANIPULATION correctly

PROOF OF THEOREM

- Suppose the algorithm failed, producing a partial ranking σ_i
- Assume for contradiction σ'_i makes p win
- $U \leftarrow$ alternatives not ranked in σ_i
- $u \leftarrow$ highest ranked alternative in U according to σ'_i
- Complete σ_i by adding u first, then others arbitrarily

PROOF OF THEOREM

- Property 2 $\Rightarrow s(\sigma_i, p) \geq s(\sigma'_i, p)$
- Property 1 and σ' makes p the winner $\Rightarrow s(\sigma'_i, p) > s(\sigma'_i, u)$
- Property 2 $\Rightarrow s(\sigma'_i, u) \geq s(\sigma_i, u)$
- Conclusion: $s(\sigma_i, p) > s(\sigma_i, u)$, so the alg could have inserted u next ■

HARD-TO-MANIPULATE RULES

- Copeland with second order tie breaking [Bartholdi et al. 1989]
- STV [Bartholdi and Orlin 1991]
- Ranked Pairs [Xia et al. 2009]
 - Sort pairwise comparisons by strength
 - Lock in pairwise comparisons in that order, unless a cycle is created, in which case the opposite edge is locked in
 - Return the alternative at the top of the induced order
