Integer Programming

Ariel Procaccia | Harvard University

INTEGER PROGRAMMING

- An integer programming (IP) problem:
 - $a_{ij} \in \mathbb{R}$ for $i \in [k] = \{1, \dots, k\}, j \in [\ell]$
 - $b_i \in \mathbb{R}$ for $i \in [k]$
 - Variables x_j for $j \in [\ell]$
- The (feasibility) problem is:

$$\begin{array}{ll} \text{find } & x_1, \dots, x_\ell \\ \text{s.t.} & \forall i \in [k], \sum_{j=1}^{\ell} a_{ij} x_j \leq b_i \\ & \forall j \in [\ell], x_j \in \mathbb{Z} \end{array}$$

IP IS NOT CONVEX

Linear programming

$$\mathcal{F} = \{x \in \mathbb{R}^\ell : Ax \leq b\}$$
$$A \in \mathbb{R}^{k \times \ell}, b \in \mathbb{R}^k$$

Integer programming

$$\mathcal{F} = \{x \in \mathbb{Z}^\ell : Ax \leq b\}$$
$$A \in \mathbb{R}^{k \times \ell}, b \in \mathbb{R}^k$$

EXAMPLE: SUDOKU

8			4		6			7
						4		
	1					6	5	
5		9		3		7	8	
				7				
	4	8		2		1		3
	5	2					9	
		1						
3			9		2			5

EXAMPLE: SUDOKU

- For each $i, j, k \in [9]$, binary variable x_k^{ij} s.t. $x_k^{ij} = 1$ iff we put k in entry (i, j)
- For $t = 1, \dots, 27$, S_t is a row, column, or 3×3 square

$$\begin{aligned} &\text{find } x_1^{11}, \dots, x_9^{99} \\ &\text{s.t. } \forall t \in [27], \forall k \in [9], \sum_{(i,j) \in S_t} x_k^{ij} = 1 \\ &\quad \forall i, j \in [9], \sum_{k \in [9]} x_k^{ij} = 1 \\ &\quad \forall i, j, k \in [9], x_k^{ij} \in \{0, 1\} \end{aligned}$$

EXAMPLE: FAIR DIVISION

- **Players** $N = \{1, \dots, n\}$ and **items** $M = \{1, \dots, m\}$
- Player i has value v_{ij} for item j
- Partition items to bundles $A_1, \dots, A_n$
- $A_1, \dots, A_n$ is **envy-free** iff $\forall i, i', \sum_{j \in A_i} v_{ij} \geq \sum_{j \in A_{i'}} v_{ij}$

1								2
1	\$30	\$50	\$2	\$5	\$5	\$3	\$5	
2	\$2	\$10	\$5	\$20	\$20	\$3	\$40	

EXAMPLE: FAIR DIVISION

- Variables: $x_{ij} \in \{0,1\}$, $x_{ij} = 1$ iff $j \in A_i$
- ENVY-FREE as an IP:

find $x_{11}, \dots, x_{nm}$
s.t. $\forall i \in N, \forall i' \in N, \sum_{j \in M} v_{ij} x_{ij} \geq \sum_{j \in M} v_{ij} x_{i'j}$
 $\forall j \in M, \sum_{i \in N} x_{ij} = 1$
 $\forall i \in N, j \in M, x_{ij} \in \{0,1\}$

IP OPTIMIZATION

- The standard formulation optimizes a linear objective function $\mathbf{c}^T \mathbf{x}$
- The problem is:

$$\begin{array}{ll} \max & \sum_{j=1}^{\ell} c_j x_j \\ \text{s.t.} & \forall i \in [k], \sum_{j=1}^{\ell} a_{ij} x_j \leq b_i \\ & \forall j \in [\ell], x_j \in \mathbb{Z} \end{array}$$

EXAMPLE: MMS GUARANTEE

EXAMPLE: MMS GUARANTEE

Total: \$50		Total: \$30		Total: \$20				
\$50		\$30		\$3	\$2	\$5	\$5	\$5
								
\$3		\$2		\$5	\$40	\$10	\$20	\$20
Total: \$30				Total: \$30			Total: \$40	

EXAMPLE: MMS GUARANTEE

- **Maximin share (MMS) guarantee** of player i : $\max_{X_1, \dots, X_n} \min_k \sum_{j \in X_k} v_{ij}$
- MMS guarantee of player i as IP:

$$\begin{aligned} & \max D \\ \text{s.t. } & \forall k \in N, \sum_{j \in M} v_{ij} y_{jk} \geq D \\ & \forall j \in M, \sum_{k=1}^n y_{jk} = 1 \\ & \forall j \in M, k \in N, y_{jk} \in \{0, 1\} \end{aligned}$$

EXAMPLE: MMS GUARANTEE

- Suppose we computed $MMS(i)$ for each i
- Now finding an **MMS allocation**, where $v_i(A_i) \geq MMS(i)$ for all $i \in N$, is just another IP:

$$\begin{array}{ll}\text{find } & x_{11}, \dots, x_{nm} \\ \text{s.t. } & \forall i \in N, \sum_{j \in M} v_{ij} x_{ij} \geq MMS(i) \\ & \forall j \in M, \sum_{i \in N} x_{ij} = 1 \\ & \forall i \in N, j \in M, x_{ij} \in \{0,1\}\end{array}$$

APPLICATION: SPLIDDIT

[DIVIDE](#) [RENT](#) [FARE](#) [CREDIT](#) [GOODS](#) [TASKS](#) | [ABOUT](#) [FEEDBACK](#)

PROVABLY FAIR SOLUTIONS.

Spliddit offers quick, free solutions to everyday fair division problems, using methods that provide indisputable fairness guarantees and build on decades of research in economics, mathematics, and computer science.

EXAMPLE: KIDNEY EXCHANGE

EXAMPLE: KIDNEY EXCHANGE

- **CYCLE-COVER:** Given a directed graph G and $L \in \mathbb{N}$, find a collection of disjoint cycles of length $\leq L$ in G that maximizes the number of covered vertices
- The problem is:
 - Easy for $L = 2$ (why?)
 - Easy for unbounded L
 - NP-hard for a constant $L \geq 3$ (in practice $L = 3$)

UNOS pool, Dec 2010

[Courtesy John Dickerson]

EXAMPLE: KIDNEY EXCHANGE

- Variables: For each cycle c of length $\ell_c \leq L$, variable $x_c \in \{0,1\}$, $x_c = 1$ iff cycle c is included in the cover
- CYCLE-COVER as an IP:

$$\begin{array}{ll}\max & \sum_c x_c \ell_c \\ \text{s.t.} & \forall v \in V, \sum_{c:v \in c} x_c \leq 1 \\ & \forall c, x_c \in \{0,1\}\end{array}$$

APPLICATION: UNOS

UNITED NETWORK FOR ORGAN SHARING

IP VS. LP, REVISITED

- Denote the optimal solutions of the two programs by OPT_{IP} and OPT_{LP}

- Poll:** Which statement is true?
 - $\text{OPT}_{IP} \leq \text{OPT}_{LP}$ ✓
 - $\text{OPT}_{IP} \geq \text{OPT}_{LP}$
 - $\text{OPT}_{IP} = \text{OPT}_{LP}$
 - $\text{OPT}_{IP} \parallel \text{OPT}_{LP}$

$$\begin{aligned} \max \quad & \sum_{j=1}^{\ell} c_j x_j \\ \text{s.t.} \quad & \forall i \in [k], \sum_{j=1}^{\ell} a_{ij} x_j \leq b_i \\ & \forall j \in [\ell], x_j \in \{0,1\} \end{aligned}$$

IP

$$\begin{aligned} \max \quad & \sum_{j=1}^{\ell} c_j x_j \\ \text{s.t.} \quad & \forall i \in [k], \sum_{j=1}^{\ell} a_{ij} x_j \leq b_i \\ & \forall j \in [\ell], x_j \in [0,1] \end{aligned}$$

LP

BRANCH AND BOUND

- The linear program (LP) relaxation gives an “admissible” heuristic!
- LPs can be solved in polynomial time!
- Branch and bound:
 - Use a search tree to assign the variables one by one
 - At each node, solve the LP relaxation
 - Prune the branch if there is no solution, or if the solution is worse than best known
